

# TEAMRGE EVENT 2024 WHERE FUTURE OF END USER COMPUTING MEETS REALITY

10+ community sessions around GPUs, VDI,  
DaaS, DEX, Remoting Protocols and AI

**15th February 2024**

**16:00 CEST / 10:00AM EDT / 07:00AM PDT**

**Register Now**

[www.teamrge.com/events](http://www.teamrge.com/events)

This FREE community event is made possible with support of:

**DIZZION**

**itq**

**EUC Score**

**Dr. Benny Tritsch**  
Managing Director at  
Dr. Tritsch IT Consulting

**Bram Wolfs**  
Consultant at  
Wolfs IT Solutions

**Eitjo van Gulik**  
Principal Product Manager  
for HDX Graphics & Seamless  
at Citrix

**Esther Barthel**  
Solutions Architect  
at Cognition IT

**Joe DaSilva**  
PMTS, Solutions Architect, Cloud  
Graphics at AMD

**Johan van Amersfoort**  
Technologist EUC & AI  
at ITQ

**Magnar Johnson**  
Manager | Solution Architect  
Sopra Steria

**Rody Kossen**  
Senior Principal Quality  
Engineer at Citrix

**Ruben Spruijt**  
Field CTO  
at Dizzion

**Ryan Ververs-Bijkerk**  
Technical Evangelist  
at GO-INIT

**Shawn Bass**  
Start-up advisor and  
former EUC CTO of Desktop  
Technologies at VMware

**Thomas Poppelgaard**  
Independent Consultant and  
Technology Evangelist at  
Poppelgaard.com

**TeamRGE**  
Remoting Graphics Experts

# PUSHING THE BOUNDARIES

EXPLORING THE SCIENCE OF USER EXPERIENCE  
AND LATENCY LIMITS IN REMOTE DESKTOP

Magnar Johnsen  
Solution Architect  
Sopra Steria

This FREE community event is made possible with support of:

# HOW FAR CAN YOU GO AND STILL HAVE A GOOD UX?

- Customer case: Company with datacenter in Norway and the clients in all continents,
- Can Virtual Desktops deliver apps with good user experience on such a distance?
- Where does the limit go and why?
- How can we measure it?
- Does it apply to all kinds of apps?

12 MACH 2020

**Magnar Johnsen** @MagnarJohnsen · Mar 12, 2020

Proud to be working for a company that can respond to additional customer demand for remote workers at this speed.

Provisioned virtual machines to

[WorkSpace Deployment Slot B](#)

Status: **Completed**

Time taken: **0:01:59**

# WHAT IS USER EXPERIENCE?

- Response time!
- The time it takes from clicking the mouse button until the screen updates.

# SOME FACTS ABOUT DISTANCES, SPEED AND ROUND TRIP TIMES

- Earth circumference is about 40 000 KM
- Norway – Australia is 14 000 KM one way
- 47 ms with the speed of light one way
- Speed of light in fiber is slower than in vacuum, about 70ms through fiber
- Round Trip Time (RTT) is 140ms in theory

# LIMITS ACCORDING TO CITRIX

# THE HUMAN NERVOUS SYSTEM

- 120 Meter per second
- 150-300 ms «responsetime» (Varies with age etc)
- Equals to 15 000 – 30 000 KM of fibercables
- Our subjective experience exists in the past! The half-second delay: what follows (ucl.ac.uk)
- In theory, possible to have a good UX within a 15 000 km distance (Norway – Australia).

# BUT FIBERS DOESN'T GO IN A STRAIGHT LINE

- Measured latency on the connection was 350-400 ms. (almost twice the distance) ?
- How can we optimize it? And what can be optimized?
- To be able to optimize, you need to be able to measure it.

# HOW CAN YOU MEASURE THE WHOLE END TO END RTT?

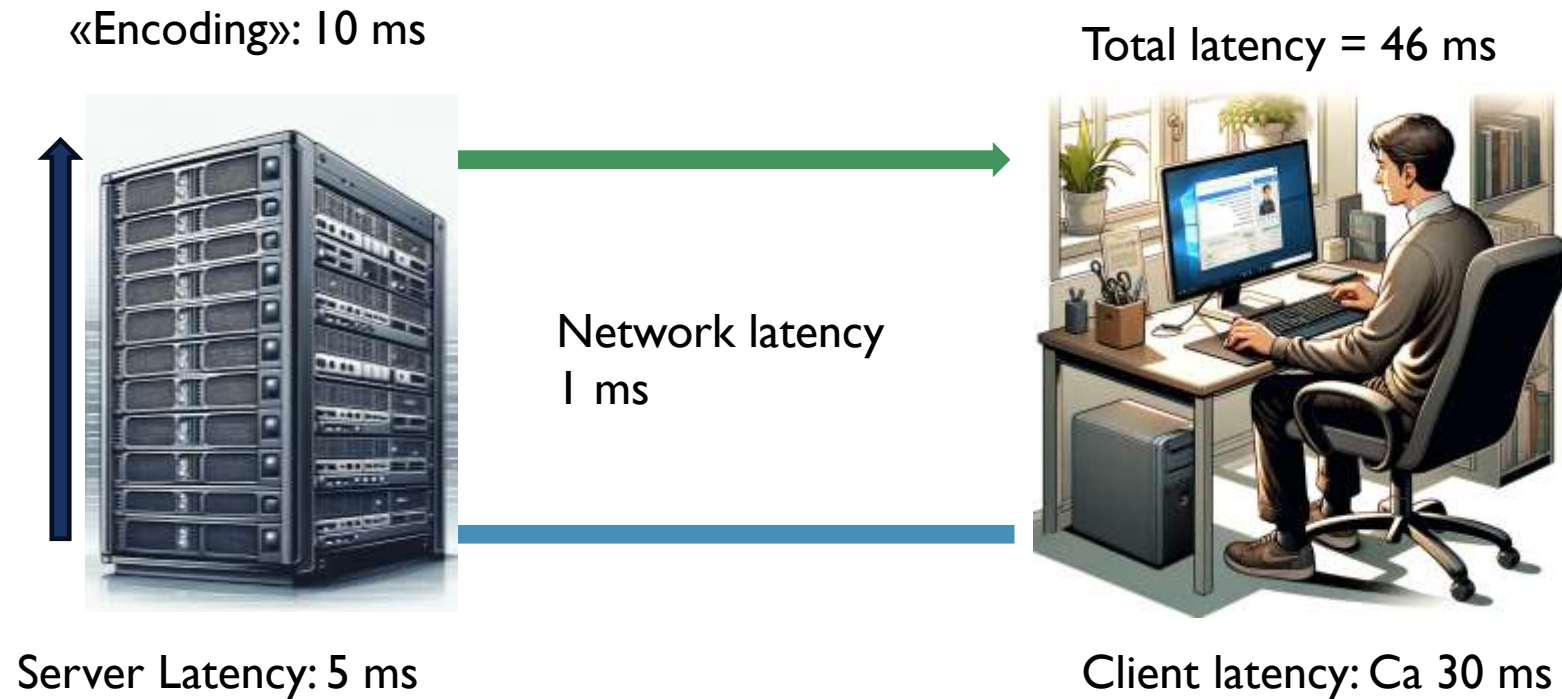

- Click-to-photon by nVidia

# TEAMRGE COMMUNITY PROJECT: UXMETER

# RESPONSTIME ON A LOCAL VIRTUAL DESKTOP

# RESPONSTIME ON A LOCAL VIRTUAL DESKTOP

# ROOT CAUSE ANALYSIS

- Internet routing took a return route around the globe!

- RTT to Singapore office was about 200ms.
- MPLS from Singapore to Australia was about 50ms
- «Forcing the traffic through MPLS to an office in Singapore
- ISP had to change routing vectors
- SD-Wan to benefit from multiple carriers
- Network latency down to 250ms

# NEW RESPONSE TIME WITHIN

# DOES IT APPLY TO GRAPHICAL APPS?

- Traditional CRM/ERP apps are good. Mostly click and text input.
- Large graphical motions are more difficult to fool the brain.
- Our eyes can detect sideways motion delays quite easily.
- Extreme example, VR streaming.

# VR STREAMING – WHERE LATENCY COUNTS

# SUMMARY

- Our human «LATENCY» makes remote desktops over extreme distances possible – Up to 150 ms or «almost half across the globe»
- Graphical apps are much more latency sensitive.
- Focus on optimizing network route.
- GPU hardware encoding can help a tiny bit, but cost \$\$\$\$. Can be worth it for graphical workloads.
- Monitor response time over time. Most remote protocols has performance counters for this or dedicated analytics tools.
- You can measure RTT with tools like RemoteDisplayAnalyser. ->Physical layer not measured.
- You can build your own UXMeter with a simple arduino, some sensors, soldering iron and a lot of time.

THANK YOU
